

Changing a TestPro REMOTE to a MAIN unit

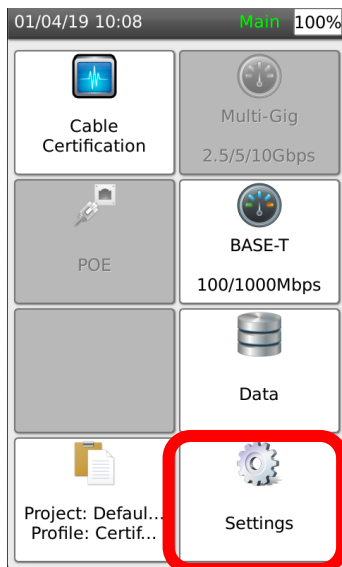

A TestPro comes with two units, originally configured one as a MAIN unit, and one as a REMOTE. This article describes the process of temporarily converting a REMOTE to a Main. Why would you want to do this?

- Having two MAIN units doubles your productivity (or halves your cost) for any test that only requires one unit. For example, you only need a MAIN unit to measure length, to test POE, or to connect to a Gigabit Ethernet switch

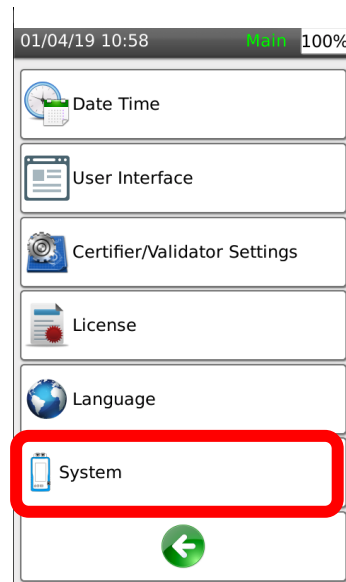

Once you are done with such testing, use the same basic process to switch one of your MAIN's back to a REMOTE. This example will show a MAIN → REMOTE conversion.

1. Select Settings

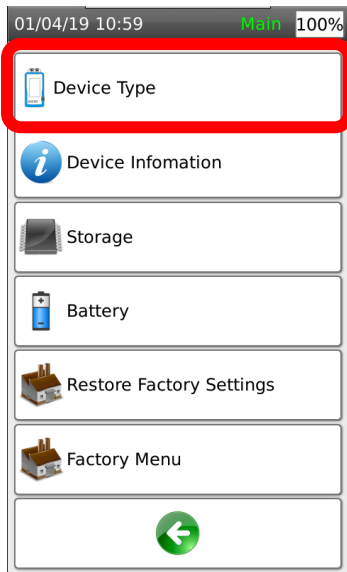

Power ON TestPro. From the Home Screen, press the Project icon

2. From the Settings screen, select System

3. From the System screen, press Device Type

5. From the Warnings Screen, press Enter. Your unit will reboot and become a Remote unit

4. From the Device Type screen, Select Remote, and press Enter
